The earis® premium transmitter

The earis® premium transmitter also serves as a charger for a receiver. It also features a charging slot for an additional receiver battery.

The earis® premium underchin receiver

The lightweight earis® premium underchin earphone with replaceable silicone earbuds guarantees maximum comfort and exerts minimal pressure on

the ears. The speaker arms are designed to be mechanically stable and are mounted in such a way that they can easily be moved for fitting into the ear canals. The speaker arms activate the on/off mechanism.

The earis® premium pocket receiver

The earis® premium pocket receiver allows the connection of a wide variety of commercially available hearing accessories via a 3.5 mm jack socket. An earis® premium neck loop is included with the receiver. Other accessories such as headphones, earphones or headsets may be used. A clip on the back of the receiver is used to fasten the receiver to clothing. An eyelet in the receiver is provided for use with a carrying cord.

The first TV listening system with sound profiling uniquely designed for hearing impaired individuals.

earis®

premium ■
... makes the TV sound!

You can relax and enjoy the sound of your TV programmes.

»earis® premium opens up a completely new dimension for hearing impaired people to experience feature films, speech and music programmes from television. The integrated dynamic sound HS provides a choice of five dynamically designed audiological hearing profiles.

These are pre-set sound profiles to accommodate different television programme formats and listening preferences.

The sound is always calculated dynamically according to the respective personal settings. A large dial is used to adjust the volume up to 122 dB (A).

»earis® premium sets are available with either an under chin receiver or a pocket receiver.

The battery is easily exchanged and earis® premium can be run with a back-up battery, if desired.

»earis® premium – aesthetics, ease of use and the highest possible sound quality are combined in a single TV listening system.

The design of earis® premium, with its LED status displays, represents a timeless appearance with an elegant high-tech accent. The large, shiny silver adjusting wheel for volume control of up to 122 dB (A) dominates the design of the receiver. LEDs provide information on charging status, hearing profile selection and volume setting.

»dynamic sound HS«

dynamic
sound **HS**

The main feature, which makes earis® premium the premium model in this class on the market, has been designated **dynamic sound HS** by Humantechnik.

Any of five sound profiles can be selected at the touch of a button.

»dynamic sound HS is based on an algorithm developed by the Fraunhofer Institute for Digital Media Technology IDMT in Oldenburg, Germany, especially for users with impaired hearing, which represents the state-of-the-art for intelligent audio: earis® premium dynamically adjusts the sound according to the personal settings of the TV viewer and automatically adjusts to the best possible individually perceived hearing quality even in changing acoustic situations.

Switching to conversation

If you want to talk to other people present in the room - for example during a commercial break – you do not have to remove your earis® premium receiver. Simply press the communication button and use earis® premium as a personal sound amplifier. You will then hear the speech of your partners at your personal volume.
